

Appl. No. 10/071,143

Amendments to the Claims:

This listing of the claims will replace all prior versions, and listings, of claims in this application:

Listing of the Claims:

Claims 1-4 (cancelled)

5. (currently amended) A method for producing a synthetic dental restorative part such as a full or partial dental prosthesis, comprising:

providing a base:

spray applying with a spray device a material having at least a polymerizable synthetic material onto [[a]] the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet thereinto in a favorable manner; and

hardening at least one already applied layer prior to the application of subsequent layers to form the dental restorative part; and wherein the material which is spray applied is a polymerizable wax-like dental material having up to 70% by weight of at least one of a polymerizable monomer and oligomer, from 0.01 to 10% by weight of a polymerization initiator, and at least 20% by weight of a mixture having a selected one of wax-like and a flowable monomer and a color pigment, and the dental material has the property that one of its physical condition and its viscosity changes within a relatively small range of temperature flux.

Claim 6 (cancelled)

7. (currently amended) A method for producing a synthetic dental restorative part according to claim 1, such as a full or partial dental prosthesis, comprising:

Appl. No. 10/071,143

providing a base;

spray applying with a spray device a material having at least a polymerizable synthetic material onto the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet therinto in a favorable manner, wherein the spray applied material is heated before being spray applied to a temperature less than the polymerization temperature of the material; and

hardening at least one already applied layer prior to the application of subsequent layers to form the dental restorative part wherein each layer is polymerized prior to the application thereonto of the next layer to a polymerized condition which is less than complete polymerization yet is such that the layer supports the retention of the next layer applied thereon.

8. (cancelled)

9. (currently amended) A method for producing a synthetic dental restorative part ~~according to claim 1~~ such as a full or partial dental prosthesis, comprising:

providing a base;

spray applying with a spray device a material having at least a polymerizable synthetic material onto the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet therinto in a favorable manner, wherein the spray applied material is a selected one of a material having a wax-like polymerizable substance having an ester of a carbon acid and a polymerizable alcohol and a

Appl. No. 10/071,143

material having an ester of an alcohol and a polymerizable carbon acid derivative of between about 20% to 99.99% by weight of the material; and

hardening at least one already applied layer prior to the application of subsequent layers to form the dental restorative part wherein each layer is polymerized prior to the application thereonto of the next layer to a polymerized condition which is less than complete polymerization yet is such that the layer supports the retention of the next layer applied thereon.

10. (cancelled)

11. (currently amended) A method for producing a synthetic material part according to claim 10 such as a full or partial dental prosthesis, comprising:

providing a base;

spray applying with a spray device a material having at least a polymerizable synthetic material onto the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet thereinto in a favorable manner; and hardening at least one already applied layer prior to the application of subsequent layers to form a dental restorative part; and wherein the synthetic material part is a dental restorative part and the production of the dental restorative part includes handling the dental restorative part with a color imparting material such that the dental restorative part has a color imparted by the color imparting material, wherein the step of spray applying a material includes contemporaneously spray applying a material onto a plurality of bases each of which, upon the build up and polymerization of the material sprayed thereon, [[from]] form a dental restorative part.

Appl. No. 10/071,143

12.(currently amended) A method for producing a synthetic dental restorative part according to ~~claim 1~~ such as a full or partial dental prosthesis, comprising:

providing a base;

spray applying with a spray device a material having at least a polymerizable synthetic material onto the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet therein into a favorable manner; and

hardening at least one already applied layer prior to the application of subsequent layers to form the dental restorative part wherein each layer is polymerized prior to the application thereonto of the next layer to a polymerized condition which is less than complete polymerization yet is such that the layer supports the retention of the next layer applied thereon, wherein one of the layers applied onto an already applied layer is relatively more transparent than the already applied layer.

13 - 14. (cancelled)

15. (currently amended) A method for producing a synthetic dental restorative part according to ~~claim 5~~ such as a full or partial dental prosthesis, comprising:

providing a base;

spray applying with a spray device a material having at least a polymerizable synthetic material onto the base in succeeding layers such that each layer of the spray applied material is polymerized by a light source mounted on the spray device, the material includes a wax like substance having a viscosity such that a run off of the just applied spray drops used for the layer building is prevented while, on the other hand, the viscosity value is so small that it is possible to perform a penetration of the spray jet therein into a favorable manner; and

Appl. No. 10/071,143

hardening at least one already applied layer prior to the application of subsequent layers to form the dental restorative part; and wherein the material which is spray applied is a polymerizable wax-like dental material having up to 70% by weight of at least one of a polymerizable monomer and oligomer, from 0.01 to 10% by weight of a polymerization initiator, and at least 20% by weight of a mixture having a selected one of wax-like and a flowable monomer and a color pigment, and the dental material has the property that one of its physical condition and its viscosity changes within a relatively small range of temperature flux, wherein the polymerization initiator is between 0.5 to 5% by weight of the wax-like dental material.

16. (previously presented) A method for producing a synthetic dental restorative part according to claim 15, wherein the polymerization initiator is between 0.5 to 2% by weight of the wax-like dental material.

17 - 18. (cancelled)
